Weavr - QA Engineer Test

<u>Front-end automation</u> - The **InterviewFrontendTest** folder contains a sample project to test a web application using Cypress. In this project you will find the configuration required to write tests for the https://www.saucedemo.com/ website. To start with, the login part has already been implemented in the sample_test.spec.js file. The requirement for this test is the following:

• Write an E2E test in the sample_test.spec.js file to buy any item from https://www.saucedemo.com/.

<u>Back-end automation</u> - The **InterviewBackendTest** folder contains a sample project to test APIs using JUnit and RestAssured. In this project you will find the configuration required to write tests for a number of endpoints by Go Rest (https://gorest.co.in/), as well as a sample test class to start with. The requirements for this test are the following:

• Using the already implemented create user endpoint, write a number of tests to cover the functionality of this endpoint
• Implement whatever is required to write tests for the update user endpoint

The information required to perform those tasks can be found here -> https://gorest.co.in/.

Feel free to update anything in both projects in any way you see fit.
